

# Implement SGD Classifier with Logloss and L2 regularization Using SGD without using sklearn

There will be some functions that start with the word "grader" ex: `grader_weights()`, `grader_sigmoid()`, `grader_logloss()` etc, you should not change those function definition.

Every Grader function has to return True.

Importing packages

```
In [1]: import numpy as np
import pandas as pd
from sklearn.datasets import make_classification
from sklearn.model_selection import train_test_split
from sklearn.preprocessing import StandardScaler
from sklearn import linear_model
```

Creating custom dataset

```
In [2]: # please don't change random_state

X, y = make_classification(n_samples = 50000, n_features = 15, n_informative = 10, n_redundant = 5,
                          n_classes = 2, weights = [0.7], class_sep = 0.7, random_state = 15)

# make_classification is used to create custom dataset
# https://scikit-learn.org/stable/modules/generated/sklearn.datasets.make_classification.html
```

```
In [3]: X.shape, y.shape
```

```
Out[3]: ((50000, 15), (50000,))
```

Splitting data into train and test

```
In [4]: #please don't change random state
# you need not standardize the data as it is already standardized

X_train, X_test, y_train, y_test = train_test_split(X, y, test_size = 0.25, random_state = 15)
```

```
In [5]: X_train.shape, y_train.shape, X_test.shape, y_test.shape
```

```
Out[5]: ((37500, 15), (37500,)), (12500, 15), (12500,))
```

## SGD classifier

```
In [6]: # alpha : float
# Constant that multiplies the regularization term.

# eta0 : double
# The initial learning rate for the 'constant', 'invscaling' or 'adaptive' schedules.

clf = linear_model.SGDClassifier(eta0 = 0.0001, alpha = 0.0001, loss = 'log', random_state = 15,
                                penalty = 'l2', tol = 1e-3, verbose = 2, learning_rate = 'constant')
clf
#https://scikit-learn.org/stable/modules/generated/sklearn.linear_model.SGDClassifier.html
```

```
Out[6]: SGDClassifier(eta0=0.0001, learning_rate='constant', loss='log',
                      random_state=15, verbose=2)
```

```
In [7]: clf.fit(X = X_train, y = y_train) # fitting our model
```

```

## Implement Logistic Regression with L2 regularization Using SGD: without using sklearn

1. We will be giving you some functions, please write code in that functions only.
  2. After every function, we will be giving you expected output, please make sure that you get that output.
- Initialize the weight\_vector and intercept term to zeros (Write your code in [def initialize\\_weights\(\)](#))
  - Create a loss function (Write your code in [def logloss\(\)](#))
 
$$\text{\$log loss} = -1 * \frac{1}{n} \sum_{\text{for each } Y_t, Y_{\text{pred}}} (Y_t \log_{10}(Y_{\text{pred}}) + (1 - Y_t) \log_{10}(1 - Y_{\text{pred}}))$$
  - for each epoch:
    - for each batch of data points in train: (keep batch size=1)
      - calculate the gradient of loss function w.r.t each weight in weight vector (write your code in [def gradient\\_dw\(\)](#))
 
$$\text{\$dw}^{\{t\}} = x_n(y_n - \sigma((w^{\{t\}})^T x_n + b^{\{t\}})) - \frac{\lambda}{N} w^{\{t\}}$$
      - Calculate the gradient of the intercept (write your code in [def gradient\\_db\(\)](#)) [check this](#)

$$\text{\$db}^{\{t\}} = y_n - \sigma((w^{\{t\}})^T x_n + b^{\{t\}})$$
      - Update weights and intercept (check the equation number 32 in the above mentioned [pdf](#)):
 
$$\text{\$w}^{\{t+1\}} \leftarrow w^{\{t\}} + \alpha(dw^{\{t\}})$$

$$\text{\$b}^{\{t+1\}} \leftarrow b^{\{t\}} + \alpha(db^{\{t\}})$$
    - calculate the log loss for train and test with the updated weights (you can check the python assignment 10th question)
    - And if you wish, you can compare the previous loss and the current loss, if it is not updating, then you can stop the training
    - append this loss in the list ( this will be used to see how loss is changing for each epoch after the training is over )

### Initialize weights

```

In [9]: #you use zeros_like function to initialize zero,
#https://numpy.org/doc/stable/reference/generated/numpy.zeros_like.html
#initialize bias to zero

def initialize_weights(row_vector):

```

```
''' In this function, we will initialize our weights and bias'''

w = np.zeros_like(row_vector)
b = 0

return w,b
```

```
In [10]: dim = X_train[0]

# w,b = initialize_weights(row_vector)
w,b = initialize_weights(dim)

print('w =',(w))
print('b =',str(b))

w = [0. 0. 0. 0. 0. 0. 0. 0. 0. 0. 0. 0. 0. 0. 0. 0.]
b = 0
```

Grader function - 1

```
In [11]: dim = X_train[0]
w,b = initialize_weights(dim)

def grader_weights(w,b):
    assert((len(w) == len(dim)) and b == 0 and np.sum(w) == 0.0)
    return True

grader_weights(w,b)
```

Out[11]: True

Compute sigmoid

$\text{sigmoid}(z) = 1/(1+\exp(-z))$

```
In [12]: # https://numpy.org/doc/stable/reference/generated/numpy.exp.html

def sigmoid(z):
    ''' In this function, we will return sigmoid of z'''

    # compute sigmoid(z) and return
    sigmoid_ = (1 / (1 + np.exp(-z)))

    return sigmoid_
```

Grader function - 2

```
In [13]: def grader_sigmoid(z):

```

## Goal of assignment

Compare your implementation and SGDClassifier's the weights and intercept, make sure they are as close as possible i.e difference should be in order of  $10^{-2}$

### Grader function - 6

```
In [25]: #this grader function should return True  
#the difference between custom weights and clf.coef_ should be less than or equal to 0.05  
  
def difference_check_grader(w, b, coef, intercept):  
    val_array = np.abs(np.array(w - coef))  
    assert(np.all(val_array <= 0.05))  
  
    print('The custom weights are correct')  
    return True  
  
difference_check_grader(w, b, clf.coef_, clf.intercept_)
```

The custom weights are correct

Out[25]: True

### Plot your train and test loss vs epochs

plot epoch number on X-axis and loss on Y-axis and make sure that the curve is converging

```
In [26]: from matplotlib import pyplot as plt  
epoch = np.arange(20) + 1  
  
plt.figure(figsize = (12,5))  
plt.plot(epoch,train_loss , label='Train Log Loss')  
plt.plot(epoch,test_loss, label='Test Log Loss')  
plt.xticks(epoch)  
plt.xlabel("Epoch number")  
plt.ylabel("Log Loss")  
plt.legend()  
plt.show()
```
